

Workshop 12: Bootstrap

Tools used: The Bootstrap fonts, JavaScript, and CSS files downloaded from the website:
<http://getbootstrap.com/getting-started/#download>

The aim of this section is to see the benefits of Bootstrap in terms of structuring a web page.

HTML code:

1. Add the meta tag:

```
<meta charset="utf-8" name="viewport" content="width=device-width, initial-scale=1">
```

2. To add Bootstrap to our index.html page, we need to load the necessary CSS and JavaScript files: bootstrap.min.css and font-awesome.min.css in the head section of my html page.

```
<link type="text/css" rel="stylesheet"
href="http://maxcdn.bootstrapcdn.com/bootstrap/3.3.1/css/bootstrap.min.css">
<link type="text/css" rel="stylesheet" href="http://maxcdn.bootstrapcdn.com/font-
awesome/4.2.0/css/font-awesome.min.css">
```

3. Next, add these two references to the end of the body:

```
<script type="text/javascript" src="http://code.jquery.com/jquery.min.js"></script>
<script type="text/javascript"
src="http://maxcdn.bootstrapcdn.com/bootstrap/3.3.1/js/bootstrap.min.js"></script>
```

4. Suggest a structure of the following HTML page:

Web Development

Model Page: Workshop 12

HTML5

HTML5 (HyperText Markup Language 5) is the next major revision of HTML (a data format designed to represent web pages). This version of HTML5 is currently under development.

HTML5 specifies two syntaxes of an abstract model defined in terms of the DOM: HTML5 and XHTML5. The language also includes an application layer with many APIs, as well as an algorithm to handle documents with non-conforming syntax.

The work was taken over by the W3C in March 2007 after being initiated by WHATWG. Both organizations are working in parallel on the same document in order to maintain a single version of the technology.

The W3C aimed to stop adding features on May 22, 2011 and finalize the specification in 2014, and encourages web developers to use HTML5 immediately.

CSS

CSS stands for Cascading Style Sheets. CSS is a computer language used on the web to style HTML or XML files. Style sheets, also called CSS files, contain code that allows the design of an HTML page to be managed.

Bootstrap

CSS framework

Bootstrap is a collection of tools useful for creating website and web application design (graphics, animations, and page interactions in the browser, etc.). It includes HTML and CSS code, forms, buttons, navigation tools, and other interactive elements, as well as optional JavaScript extensions. It is one of the most popular projects on the GitHub development platform.

Text used on my HTML page:

- For the HTML5 paragraphs

`<p><abbr title="HyperText Markup Language 5">HTML5</abbr> (HyperText Markup Language 5) is the next major revision of <abbr title="HyperText Markup Language">HTML5</abbr> <em>(data format designed to represent web pages)</em>.`

`This HTML5 version is currently under development.`

`<p>HTML5 specifies two syntaxes for an abstract model defined in terms of the DOM: HTML5 and XHTML5. The language also includes an application layer with numerous APIs, as well as an algorithm to handle documents with non-compliant syntax.<br/>`

`The work was taken over by the W3C in March 2007 after being initiated by the WHATWG. The two organizations are working in parallel on the same document in order to maintain a single version of the technology.`

`The W3C aims to close feature additions by May 22, 2011, and finalize the specification in 2014, and encourages web developers to use HTML5 now.`

- For the CSS paragraph:

Web Development

The term CSS is an acronym for Cascading Style Sheets. CSS is a computer language used on the internet to style HTML or XML files. Style sheets, also called CSS files, contain code that manages the design of an HTML page.

Regarding the bootstrap section:

This is a collection of tools useful for creating the design (graphics, animation, and interactions with the page in the browser, etc.) of websites and web applications. It's a set that contains HTML and CSS code, forms, buttons, navigation tools, and other interactive elements, as well as optional JavaScript extensions. It's one of the most popular projects on the GitHub development management platform.

CSS code:

1. Add a container class that groups all the content of my page
2. Add the Bootstrap classes for each element of my web page that allow it to be positioned relative to other elements:
Note: my grid is composed of 12 columns.
3. To add a rounded border around the header and footer of this page with a gray background color: add the two classes `.row`` and `.well``
4. To align paragraphs, use the `.text-justify` class.
5. To add the Twitter icon, use the `.fa` (font awesome icon) class, specifying the Twitter icon with: `class="fa fa-twitter"`
6. Remove the list style with the class: `list-unstyled`
7. Use colors for text using the `text-primary` and `text-info` classes...
8. Define a navigation element using the ``tab`` class to obtain the following display:
